Exec Summary: Legacy Systems X-ray + Navigator

AI-assisted understanding for mainframes and monoliths

Business Problem

- **Critical COBOL / FORTRAN / PL/SQL / Java monoliths** run the core business, but knowledge is trapped in **a few SMEs**
- Onboarding new engineers and doing impact analysis for changes **takes weeks**, slows releases, and increases risk
- **“Just give 5 developers a copilot”** improves individuals, but does not create an organization-wide understanding of the estate

Evaluation only.

Tier 1 – Legacy System X-ray (Assessment, 4-6 weeks)

- Parse legacy code, jobs, and schemas into a system map: modules, interfaces, key business entities.
- Produce entity-to-code impact maps (e.g., Customer, Account, Policy) and hot-spot analysis.
- Ship a lightweight “Ask Your Legacy System” demo to query flows and rules with traceable code references.

Tier 2 – Legacy Code Navigator (7-10 weeks)

- Turn the X-Ray into a production-grade knowledge layer for daily engineering work.
- Pre-built “query recipes” for impact analysis, business flow tracing, and “explain this program” – always with file paths and line numbers.
- Provide guided onboarding walkthroughs for new engineers; optional IDE/web integration, deployed in client VPC.

Tier 3 – Modernization Accelerator (10-12 weeks)

- Use the knowledge layer to prioritize and de-risk modernization (strangler pattern, refactors, re-platforming).
- Generate candidate interface specs, sequence diagrams, and test suggestions from existing flows.
- Support teams with AI-assisted refactoring, so new code preserves legacy semantics while moving to modern stacks.

How is this different from “Just give the team a Cursor / Claude code license”

Business Outcome

We build a **persistent system model** (call graphs, data flows, entity maps), not just ad-hoc file summaries

Knowledge is **shared and governed** across teams (onboarding tours, impact reports, dashboards), not stuck in individual IDE histories

Everything runs in a client-controlled **environment** (on-prem/VPC), with auditability and traceability for

regulators

- Reduce onboarding time on legacy systems from **months to weeks**
- Cut the effort for impact analysis of major changes from **days to hours**
- Lower dependency on a handful of legacy SMEs and create a **living knowledge base** for future modernization
